Troubleshooting

Q:When image is pressed, the color of the design is faded or transfers are not fully transferred onto the mug(s).

A: Reason comes from three points, there is little to no pressure, the temperature is not hot enough, or it is pressed for too little time. Test different points to get a better transfer.

Q:After transferring my image has shifted or “ghosted”.

A: During the pressing process, the image may have shifted positions on the mug causing ink to continue imprinting but in a different spot. We recommend to use heat tape to secure the image on your substrate so that it doesn't shift at any point.

Q: How to get a reasonable pressure.

A: Adjust the pressure by turning the knobs and lock down the handle. There should be a larger resistant force soon after.

Q: Turn on the power, but the mug press machine does not work.

A: Please check the power plug to see if it is well connected to the socket; if problem persists, turn to our support team for help.

Q: Pressure knob is too hard to adjust.

A: Adding lubricant oil to make the joint smooth.

Q: The temperature remains unchanged in P-1 and cannot go up anymore

A: Press Timer Start button to restart machine. If problem persists, turn to our support team for help.

Q: The mug press machine has peculiar smell during operation.

A: It is normal when you heat the silicone material on the heater element.

Q: I want to apply my image on different mug sizes.

A: You can order additional heating elements for 12 oz, 15 oz and 17 oz. Contact **sales@graphicsone.com** or visit **www.graphicsone.com.com**
